

OT Visibility Checklist

Build A Clearer Picture Of Your Connected Environment

Use this checklist to guide conversations, record what is known and identify where further visibility may help.

What You Know Now

You do not need a perfect inventory to begin. Use the questions inside to identify what is clear, what has changed and where more information may be needed.

A clearer baseline can make future operational, security, compliance and improvement decisions easier to discuss.

Use The Checklist To Find The Gaps

Different teams, suppliers and systems often hold different parts of the picture. Use this checklist to bring that information together and identify what is known, what is uncertain and what may need further investigation.

Who Can Use It?

Anyone helping to manage connected buildings, estates, infrastructure or operational systems.

How To Use It

Work through the prompts, record what is known and flag anything that needs confirming.

Bring Together The Right Perspectives

Invite the people who understand the site, systems, suppliers and operational priorities.

What Is Known?

Start with existing records, conversations and practical experience.

What Is Uncertain?

Keep assumptions and unknowns visible so they can be followed up.

Who Can Confirm It?

Record the person, team or supplier who may hold the missing detail.

Useful Starting Points

Bring together the information and people who already hold parts of the picture.

Existing Records

Asset registers, drawings and maintenance records.

People And Suppliers

Facilities, engineering, IT and service providers.

Recent Changes

Projects, replacements, upgrades or changes in use.

Keep In Mind

This is not about creating a perfect record in one sitting. It is a structured way to make the current picture easier to understand.

Define The Environment You Need To Understand

Start by agreeing what you are trying to understand. A clear scope makes the information you gather easier to organise, compare and revisit.

Sites And Buildings

Which locations, buildings or estates are included?

Systems And Areas

Which operational systems, plant or areas should be considered?

Network Boundaries

Are there connected services, platforms or environments to include?

Third Parties

Are supplier-managed or contractor-supported areas part of the picture?

Record The Scope

Record each part of the environment you want to understand. Use one row for each location,

Area Or Location	What Is In Scope?	Who Can Confirm?
Sites / buildings		
Systems / areas		
Network boundaries		
Third-party areas		

Keep In Mind

A clear scope helps distinguish what has been considered from what still needs to be confirmed.

Identify Connected Systems And Devices

Record the systems and devices that support day-to-day operations. Use broad categories first, then add detail where it is available.

- Building Management
- Lighting And Controls
- Sensors And Meters
- HVAC
- Access Control
- Energy And Specialist Systems

Record What You Know

Use the starter categories below, then add detail where it is available.

System Or Device	Location	Purpose	Owner / Operator	Known Connection?
Building Management				
HVAC				
Lighting And Controls				
Access Control				
Sensors And Meters				
Energy And Specialist Systems				

Keep In Mind

If you cannot confirm a system or device, record the uncertainty rather than leaving it out.

Check How Current The Information Is

Information can be useful without being complete. The next step is to understand when it was checked, where it came from and what may have changed.

- When Was It Last Checked?** Record the date or period when the information was last confirmed.
- What Source Supports It?** Note whether it came from a record, conversation, supplier or scan.
- What Has Changed Since?** Consider projects, replacements, upgrades or changes in use.
- How Confident Are You?** Mark where the information is confirmed, assumed or still unknown.

Record The Information Quality

Information	Last Checked	Source	Confidence	Gap To Follow Up
Asset / record				
System / device				
Supplier / access record				

Keep In Mind

A record becomes more useful when it shows both what is known and how confident you are that it is still accurate.

Understand Connections And Responsibilities

Visibility becomes more useful when it is connected to ownership, relationships and day-to-day operations.

How Do Systems Communicate?

Which networks, platforms or services exchange information?

Who Has Access?

Which suppliers, integrators or support teams may connect remotely?

Who Owns The Picture?

Who can confirm what is connected, why it is there and what happens next?

Capture What You Can

Use the table to bring together notes from different people and sources.

Question	What Do We Know?	Owner	Last Checked
How does it connect?			
Who has access?			
Who owns the picture?			

Keep In Mind
If responsibility is unclear, record that as a useful finding. It shows where a clearer answer may help.

Turn Unknowns Into Practical Actions

The aim is not to create a perfect record in one sitting. It is to make the next useful action easier to identify and own.

Record The Gaps That Need Attention

Information Gap	Who May Help?	Next Action	Target Date
Unknown device or system			
Unclear responsibility			
Out-of-date record			
Other gap			

Keep The Record Useful

- 1 Date It**
Record when the information was gathered and what it covered.
- 2 Note Gaps**
Keep assumptions and unknowns visible so they can be followed up.
- 3 Revisit It**
Update the record after changes, projects or new information.

Keep In Mind

A clearer record can help conversations move from What is this? to What should we do next?

Decide What Comes Next

Once you have a clear understanding of the gaps, you can decide what makes sense for your organisation.

What Can Come Next?

Continue Internally Exploring

Use the information you have to coordinate owners, confirm scope and plan updates.

OT Visibility Review

Create a clearer view of connected OT devices and the information around them.

Consider Further Support

Explore further assessment, risk prioritisation or improvement planning.

You do not need to wait for a deadline. You can start building a clearer picture now.

Discuss Your Starting Point

Smart Net Zero can provide an OT Visibility Review and a report of the information gathered. You can use this to support internal discussions and future decisions.

The review can begin with a scan to help establish a list of connected OT devices.

[Discuss An OT Review](#)

This checklist is a conversation aid, not a technical inventory or vulnerability assessment.
